

In the process of evaluating CAD-CAM software to find the right system for your shop, you will have many questions. We're interested in helping you along the way with the potential of having you as a part of our BobCAD-CAM team! And so, that leads us to the million dollar question: Why BobCAD-CAM?

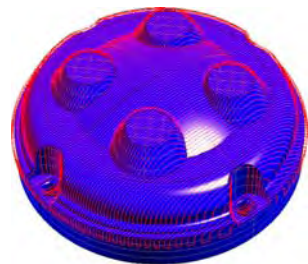

1. Well, Our CAD-CAM software is more robust than conversational programming and just as, if not more, project oriented than mid-range system in terms of price.

Why is this good? Having a PC Based CAM system that works directly with external CAD software will effectively decrease your per-part programming time without doubt.

2. Full Functionality CAD-CAM. Our software arrives at your shop with all features turned on. And, if "out of the box" the software will not do everything you need it to do, our macro and scripting functions allow you to customize the software to better suit your requirements. We offer our CAD-CAM systems complete, meaning that there aren't extra modules to purchase.

3. High quality training materials and multimedia videos are very successful in training the operator to become successful with our software fast. Between our international web forum, training books, CD videos & 3-day training seminars you can learn to program your parts and open the door to projects that you may have turned away in the past.

4. The CAM aspect of our software is effective in creating clean 2, 3 & 4 axis toolpath and G-Code that fits your controller specifications. BobCAD-CAM has always made post processor customization possible. In addition, if you need us to, we'll assist you with the right customizations so that you are up and running quickly. Our software includes full RS 232 communications and DNC capabilities if you have a PC based controller. From job shops to mold shops to the home machinist, BobCAD-CAM software will help you make your parts.

5. BobCAD-CAM has the right system for you. We offer 4 main CAD-CAM systems. You may not need the advanced functionality of solid modeling or surface machining. You may be looking for a 2D CAD-CAM system for profile machining or hole drilling. Maybe pocketing or engraving. If this is what you need, start off with the right system and upgrade as you need to. We will evaluate your needs and help set you up with the right CAD-CAM system.

6. Cost vs. functionality. Let's face it. There are a lot of CAD-CAM systems out there today. What sets BobCAD-CAM aside from the other systems is the amount of CAD & CAM functions that you get for the price. While price is not everything, it *is* important. We like to focus more on the wide range of easy to use functions and capabilities that we can offer you rather than the price tag. However, we are certain that you will be impressed at this added benefit!

BobCAD-CAM software is not the only CAD-CAM system available, nor is it the most powerful software available. However, our CAD-CAM systems have a place in every shop. With over forty thousand seats of BobCAD already in use, we have proven to help shops increase productivity, save time and increase profits on every job it's used on. If you are new to CAD-CAM or not, you will see the benefits of adding to your manufacturing arsenal!
